# vertesia

Vertesia is an API-first platform for building AI/LLM applications.
It enables enterprise teams to design, test, deploy, and operate LLM-powered tasks that automate and augment their line of business processes and applications thanks to a design studio, advanced LLM virtualization layer, and an orchestration engine.
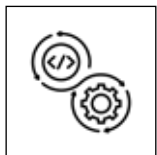

Governance
End-to-end governance of LLM agents and LLM-powered tasks

Security
Fine-grained security, keys restricted to tasks, short-lived restricted public keys, automated key rotation, etc.
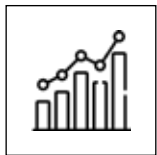

Orchestration
Create a reusable library of composable prompts

Collaboration
Iteratively design tasks as a team, bring the business and developers together with version control

Analytics
Follow model performance, visualize result quality

Monitoring
Capture each run - including input & results, monitor availability and performance

Fine-Tuning
Easily create training dataset from runs, enable fine-tuned models

Autopilot
Automate fine-tuning with Synthetic LLM, automatically create training datasets

API Service
Publish REST API endpoints, ensure schema validation, and minimize call latency

Executions Store
Intelligently store & reuse Interaction Results, control cache refresh rates, leverage vector indexing for swift data retrieval

Design & assemble reusable cross-model components to support:

USE CASES
across teams

Create Summaries
Extract metadata or review a document

Co-Pilot
Assist a user in a task

Re-Purpose Content
Generate a test, training, custom CTAs, draft copy

Marketing | Product Development & Engineering | Customer Service & Support
Finance & Risk Management | Supply Chain & Logistics | Human Resources | Legal & Compliance
